Abstract

Between 2 May 2022 and 26 May 2022, AECOM archaeologists and scientific divers, along with archaeologists from the City of Alexandria (City) and the Maryland Archaeological Conservation Laboratory (MACL) and personnel from Connelly and Associates, relocated historic ship timbers associated with three shipwrecks documented as features at site 44AX235 from the City warehouse, on 116 S Quaker Ln to Ben Brenman Pond, at 4800 Brenman Park Drive, for medium-term storage (e.g., 20-25 years). Prior to the relocation, scientific divers prepared the pond bottom with geogrid material, set in place with temporary anchors. Ship timbers were then wrapped and bundled in geofabric at the City warehouse for transport to the pond. Timber bundles varied in the number of timbers included with each bundle. No matter the quantity of timbers included in a bundle, each was tagged with a unique number for future identification. After transport to the pond, each timber was lowered to the geogrid material and secured with heavy duty zip ties within areas designated for each individual ship. In total, AECOM relocated 1,185 timbers contained within 769 bundles to Ben Brenman Pond. An additional 34 timbers were retained by the City for conservation.

On 8 June 2023, AECOM and conservators from the City and MACL performed Year 1 Condition Monitoring of timbers pre-selected in 2022 before submersion. AECOM pulled the monitoring bundles and the City and MACL conducted condition testing. Following the testing, AECOM re-secured the monitoring timbers to the geogrid material and made observations of the overall site condition. AECOM completed eight dives during the Year I Condition Monitoring.

1. Introduction

1.1 Project Background

In 2018, archaeologists from Thunderbird, Inc., documented and recovered the remains of three mid- to late eighteenth-century shipwrecks during archaeological investigations in advance of development of Robinson Terminal South in the City of Alexandria (City), Virginia. These wrecks were documented within the larger Robinson Terminal South site, 44AX235, as Features 155, 159, and 200. All three shipwrecks were determined to be historically significant under the Alexandria Archaeological Protection Code (The Zoning Ordinance of the City of Alexandria, Section 11-411). Following this determination, a mitigation effort to recover the shipwreck remains commenced. After their recovery, archaeologists from Alexandria Archaeology placed the disarticulated timbers in above-ground swimming pools for short-term preservation at a City warehouse in partnership with City facilities.

The City contracted AECOM in 2022 to perform the relocation of the historic ship timbers from 44AX235 from the City warehouse at 116 South Quaker Street to Ben Brenman Pond, a city retention pond located within the larger Ben Brenman Park complex at 4800 Brenman Park Drive (**Figures 1 and 2**). The project was performed to relocate the timbers to an environment suitable for medium-term storage and preservation. The timbers are anticipated to be stored in Ben Brenman Pond for 20-25 years. In addition to ponding the shipwreck timbers, archaeologists from the City of Alexandria selected several timbers for future monitoring activities for each shipwreck in consultation with conservators from the Maryland Archaeological Conservation Laboratory (MACL).

On 8 June 2023, AECOM and conservators from the City and MACL performed Year 1 Condition Monitoring of timbers pre-selected in 2022 before submersion. AECOM pulled the monitoring bundles and the City and MACL conducted condition testing. Following the testing, AECOM re-secured the monitoring timbers to the geogrid material and made observations of the overall site condition. AECOM completed eight dives during the Year I Condition Monitoring.

1.2 Key Personnel

Scott Seibel, Registered Professional Archaeologist (RPA) acted as Project Manager, Adam Parker, RPA served as the Marine Project Archaeologist and prepared the report, and Luka Eglesia acted as archaeological crew chief. Benjamin Stewart served as the project's Safety Officer as well as the truck driver for transporting timbers from the City warehouse to Ben Brenman Pond. The scientific dive team included Chris Marshall, Ashley Mathews, James Salafia, and Isaiah Mosley, Joe Grinnan, RPA; and Austin Burkhard, RPA. Archaeological crew members involved in preparing the timbers in the City warehouse included Alex Dorosin, Charles Simpson, Jessica Devlin, Travis Corwin, Raymond Baird, and Collin Strine-Zuroski.

Other key personal included John Sottile and Dalton Sottile of Connelly and Associates, who operated the telehandler at Ben Brenman Pond and Nichole Doub from MAC who acted as a conservation consultant. Archaeologists from the City included Tatiana Niculescu, PhD; Eleanor Breen, PhD; Ben Skolnik, PhD; and Garrett Fesler, PhD.

1.3 Report Structure

This report offers an introduction to the project in Chapter 1 and identifies key project personnel. Chapter 2 provides a brief background of Alexandria's maritime history and the three shipwrecks found at 44AX235. Chapter 3 discusses the methods used to resubmerge the shipwreck timbers for medium-term storage, and Chapter 4 discusses the project results. **Appendix A** includes all daily reports, and **Appendix B** includes a catalog of all timbers prepared during the project, including those that were set aside for conservation and those unable to be ponded. **Appendix C** includes the Virginia Cultural Resources Information System Site Form for the new site. **Appendix D** contains field notes from the Year 1 Condition Monitoring activities.

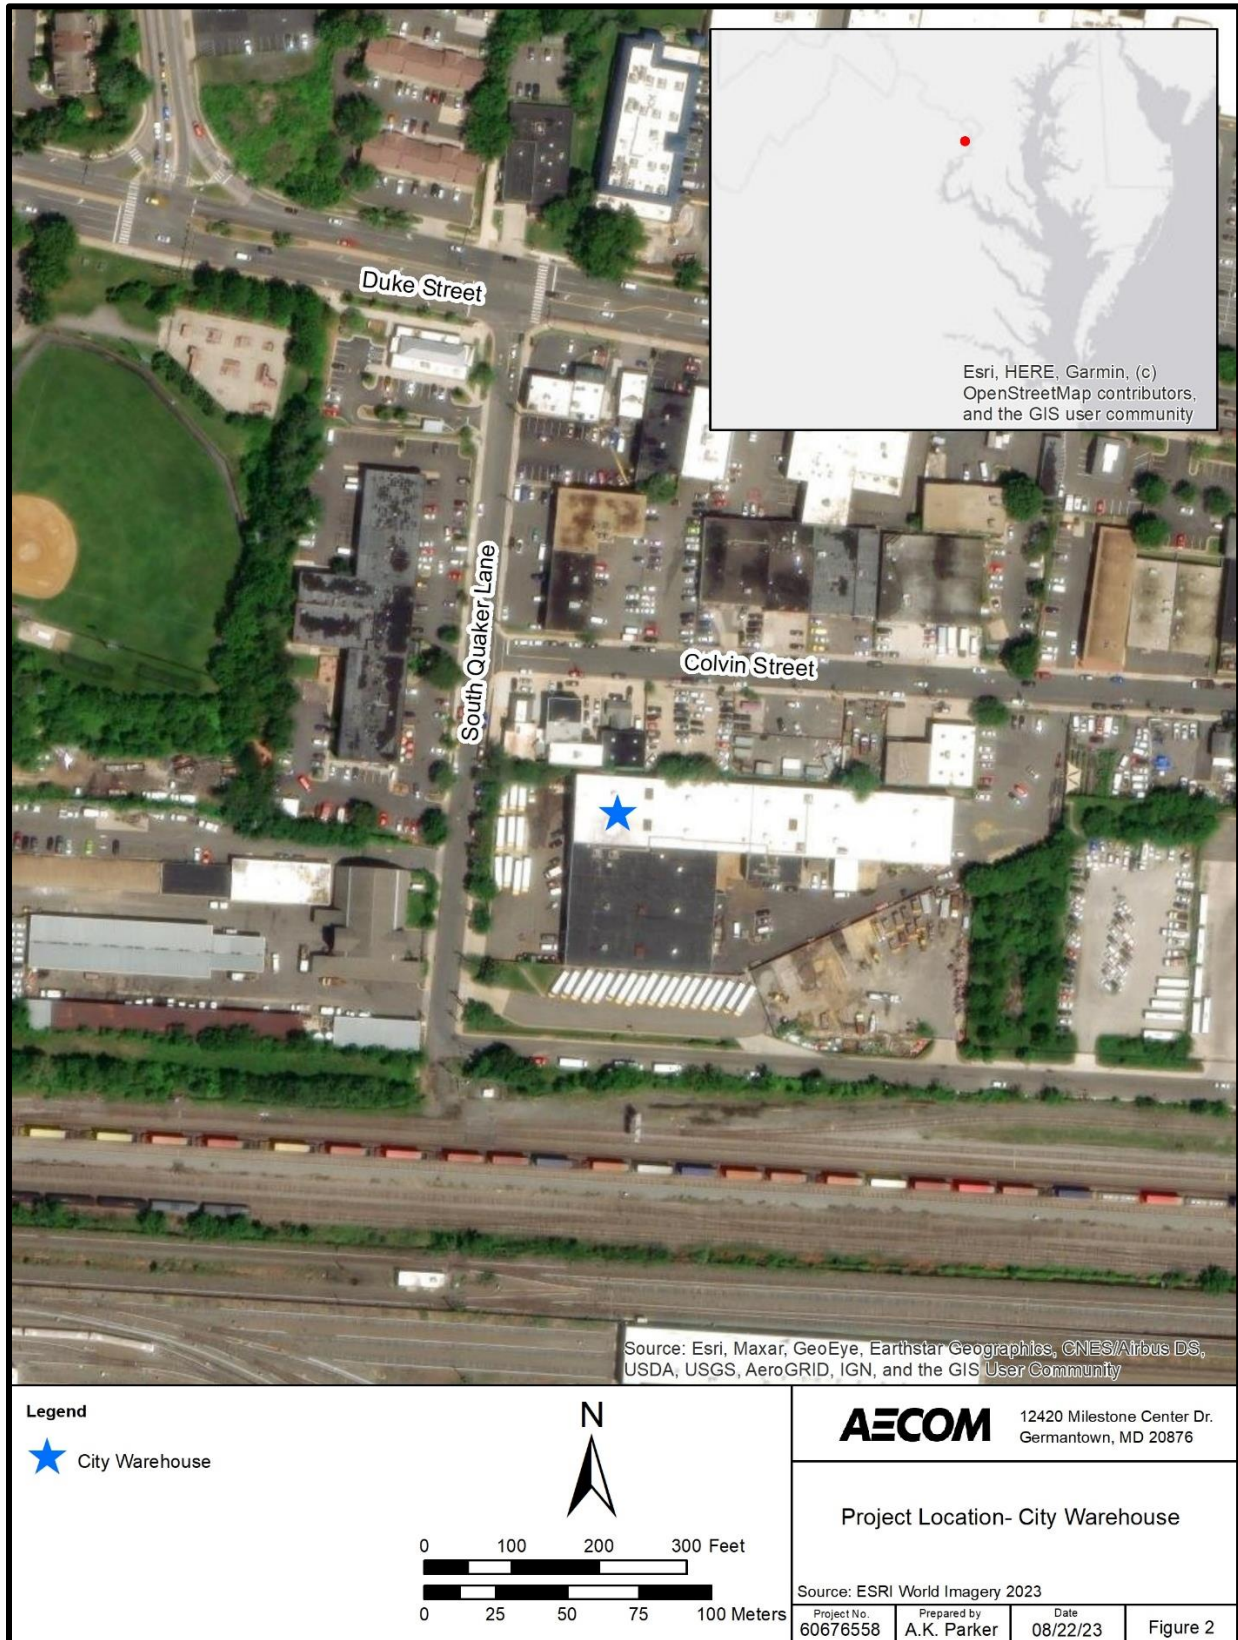

Figure 2. Project location at the City warehouse in City of Alexandria, VA.

2. Historical Background

The following section provides a brief narrative of Alexandria's maritime history. In doing so, the three shipwrecks are placed in a contemporary context in which they would have operated during their service careers and later as wharfing infrastructure.

2.1 Maritime History of Alexandria

Portions of the land Alexandria was founded on were originally granted in 1669 as part of a 6,000-acre tract to an English sea captain Robert Howson. King Charles II granted the land to Howson for bringing 120 settlers to Virginia and the tract extended along the Potomac River from Hunting Creek to the Little Falls. Howson sold the tract to John Alexander a month later for three tons of tobacco (City of Alexandria 2022a).

For much of the next century, the land remained sparsely settled; however, in 1732, Hugh West established a tobacco warehouse on Hunting Creek overlooking a small bay at the end of present-day Oronoco Street. John and Philip Alexander farmed the surrounding land while West operated the warehouse in addition to a ferry and tavern. Fairfax County was established in 1742 but many of the area's scattered planters lived inland with no immediate commercial center for export of their crops or import of manufactured goods. Thus, merchants with real estate in Cameron, a small village four miles west of the Potomac, petitioned the Virginia General Assembly to establish a town at West's tobacco warehouse in 1748. The petition was approved and in early 1749, Fairfax County surveyor, John West, and his assistant, future president George Washington, laid out 60 acres with lots auctioned off in July 1749 (City of Alexandria 2022a).

Almost immediately, waterfront owners began extending the shoreline into the small bay. The bay was crescent-shaped and extended from West's Point in the north (now on Oronoco Street) to Point Lumley in the south (now the foot of Duke Street) (**Figure 3**). Water depths in the bay were approximately four to five feet (ft; 1.2 to 1.5 meters [m]) but the main river channel was up to 48 ft (14.6 m) deep. In order to reach the deeper channel for shipping, waterfront residents, who retained ownership of any new land they created, began infilling the bay through a process known as banking out (City of Alexandria 2022b).

The process of banking out was a labor-intensive method of building out the shoreline. A three walled structure would be built along the shoreline and infilled with soil. The structures were constructed in several different ways, including cribbing, cobbing, or grillage methods. Known as wharves or quays, they differed from piers and jetties in that they were specifically constructed parallel to the shoreline (with piers and jetties constructed perpendicular to the shoreline). In lieu of building a structure to be infilled, at times, derelict ship hulls were used instead. Often, the vessel hull was cut along the keel to and embedded in the existing shoreline or inserted as one side of a crib structure before infill activities (Shepard 2006).

Over the next several decades, Alexandria prospered as a regional trading entrepot. In the 1780s, more land reclamation projects occurred and by 1798, most of the bay Alexandria had been founded on and portions of the Potomac River shoreline were filled. By doing so, merchants were able to construct piers extending to the deeper river channels accessible to ocean-going vessels, thus allowing for more extensive trade networks (City of Alexandria 2022a).

Figure 3. The 1749 planned layout of Alexandria (courtesy of the Library of Congress).

Beginning in 1779, Alexandria became a port of entry for foreign vessels, and by the end of the eighteenth century, it was one of the 10 busiest ports in America and had been designated as an official port of entry by the end of the century. This allowed foreign vessels to unload cargoes without first registering at another port. During this period, flour and hemp were major exports, along with other grains, which were shown to be more profitable than tobacco by northern Virginia planters (City of Alexandria 2022a). Alexandria was a port which connected regional coastal trade networks and saw a wide variety of vessels associated with coastal trade including sloops, schooners, barges, lighters, and brigs. International export is evidenced by the logbook of the schooner *Enterprise*, which made three voyages to Caribbean ports in 1803 and one transatlantic voyage to Spain, France, and Great Britain in 1804 (Arlington County Circuit Court 1804). Additionally, Alexandria was a port of entry for both the Atlantic slave trade and was an active center for in the domestic slave trade (City of Alexandria 2022a).

2.2 Robinson Terminal South Ship Remnants

In 2018, in advance of the Robinson Landing development, archaeologists from Thunderbird, Inc. excavated large portions of the former site of the Robinson Terminal South warehouse. Excavations led to the discovery of a late eighteenth/early nineteenth-century neighborhood, steam grist mill, a bakery, warehouses, wharves, wells, privies, and the remnants of three ships, identified as Features 200, 155, and 159 (Ships 1, 2, and 3, respectively) (Skolnik 2018). Collectively, all these sites and features were included in archaeological site 44AX235 (Figure 4). At the time of this report, the archaeological site report is not finalized.

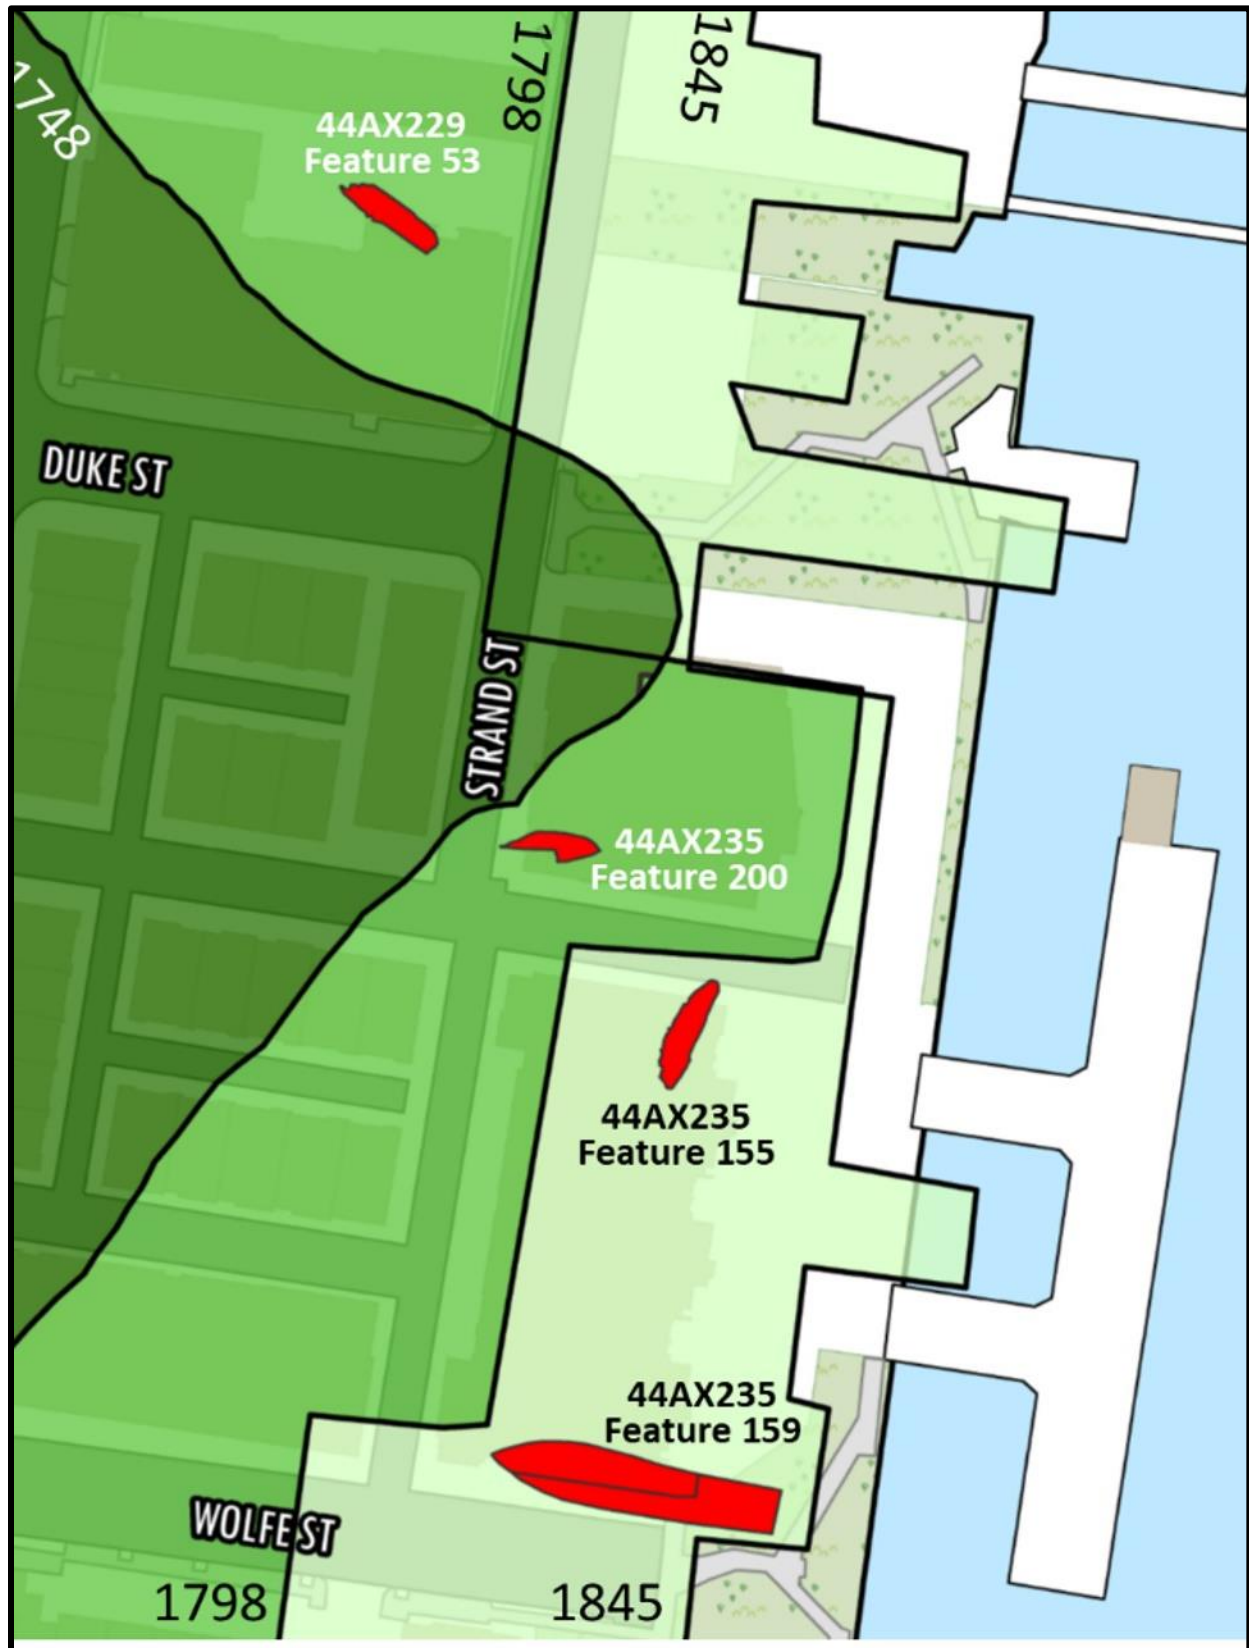

Figure 4. 44AX235 Features 155, 159, and 200 and the reconstructed 1748, 1798, and 1845 shorelines (Courtesy of Alexandria Archaeology).

According to historical deed research, Site 44AX235 occupies the eighteenth-century Lot 85. Thomas Fleming purchased the lot in 1763 from town trustees. In 1770, James Kirk, a local merchant, purchased the lot from Fleming. Prior to James' 1786 death, the Kirk family constructed a wharf and extended the shoreline. His widow leased parcels on the lot until her death in 1797, when her son Robert took ownership of the lot. They continued to lease parcels and in 1830, Robert's wife Sarah sold Parcel 5 to Henry Dangerfield. Dangerfield sold the property to James Green in 1843 (City of Archaeology 2022b). Beginning with James Kirk, Lot 85 underwent significant development including using derelict vessel hulls in wharf construction and land reclamation.

2.3 Feature 200- Ship 1

Feature 200 is the smallest of the vessels documented at 44AX235. The recovered hull remains measure approximately 43 ft long by 16 ft wide (13.1 m by 4.9 m) and consist of the vessel's starboard half up to the turn of the bilge and first futtock (loset and Grieco 2022) (**Figure 5**). The vessel remains were found between the reconstructed 1748 and 1798 shorelines (see **Figure 4**). A wharf structure was built on top of the hull remains. The feature is considered to be the remains of a lighter, a vessel class typically engaged in landing cargoes from larger, ocean-going vessels, coastal trade, and as pilot boats. The vessel's projected deck measurements while it was in service are 49 ft (14.9 m) long and 14 ft (4.3 m) wide, with a depth of 6.5 ft (2.0 m) (Chapman 1768; loset and Grieco 2022).

2.4 Feature 155- Ship 2

Feature 155 is the second largest of the vessels documented at 44AX235. The recovered hull remains measure approximately 46 ft long by 12.5 ft wide (14.0 m by 3.8 m) and consist of vessel's starboard half, up to the turn of the bilge and the first futtock (loset and Grieco 2022). The vessel remains were found between the 1798 and 1845 reconstructed shorelines (see **Figure 4**). A wharf structure was built on top of the hull remains (**Figure 6**). It is considered to be a sloop, a vessel class heavily involved in regional coastal trade. Sloops, in addition to schooners, were the backbone of the colonial and early American merchant fleet. Due to the small, burgeoning trade networks in the colonies and immediately after American Independence, the wait times to fill the hold of a larger vessel meant fewer profits for merchants. Thus, smaller vessels with less room in their holds were preferred to fill a cargo hold and leave port quickly (Southerly 2011). The vessel's projected deck measurements while it was in service are 62 ft (18.9 m) long, 19 ft (5.8 m) wide, with a depth of 7 ft (2.1 m) (Chapman 1768; loset and Grieco 2022).

2.5 Feature 159- Ship 3

Feature 159 is the largest vessel documented at 44AX235. The recovered hull remains measure 85 ft long by 30 ft wide (25.9 m by 9.1 m) and consist of a large portion of the starboard hull with portions extending beyond the turn of the bilge to include the second futtock (loset and Grieco 2022). The vessel remains were found between the 1798 and 1845 reconstructed shorelines (see **Figure 4**). A wharf structure was built on top of the hull remains. The vessel was located immediately below Wolfe Street. Because of this, the ship remains were not completely exposed by archaeological excavation. Instead, exposed portions of the shipwreck aligned with the development footprint and the hull structure was cut for timber recovery. The port half of the hull remains in situ under Wolfe Street (**Figure 7**; City of Alexandria 2022c). The vessel is considered to be an ocean-going ship, able to carry large cargoes between the Americas and Europe. Currently, it is believed to be the largest colonial merchant vessel excavated in the United States.

The vessel's projected deck measurements while it was in service are 102 ft (31.1 m) long, 25 ft (7.6 m) wide, with a depth of 11 ft (3.4 m) (Chapman 1768; Ioset and Grieco 2022).

3. Methods

The approach to relocating the historic ship timbers consisted of a multistep process including preparing the pond bottom, preparing and wrapping the timbers at the City warehouse, transporting the timbers to Ben Brenman Pond, and finally ponding the timbers and securing them in the pond bottom for medium-term storage.

3.1 Scientific Diving Operations

Prior to field work, AECOM developed a Dive Operations Plan (DOP) detailing anticipated diving procedures and safe diving protocols. All dive operations were conducted under the American Academy of Underwater Sciences standards (AAUS; AAUS 2019). These standards include the appropriate level of diver certifications, current Cardiopulmonary Resuscitation, First Aid, and Oxygen Administration certifications, a current diver physical signed by a licensed physician, and the prerequisite experience and training consistent with AECOM scientific diving standards. All dive equipment used by AECOM during the dive operations is maintained according to manufacturer standards.

Archaeological diving operations were performed from shore and supported by two 5-ft by 10-ft (1.5-m by 3.0-m) floating dock sections connected by a wooden A-frame. Safety equipment included diver down flags, a floating backboard, portable Automatic External Defibrillator (AED), and an emergency oxygen kit.

AECOM's scientific dive team consisted of four members: Two primary divers, a standby/rescue diver, and a topside supervisor. Prior to each dive, the topside supervisor gave a pre-dive briefing to each working diver for the dive objectives. Following the briefing, primary divers prepared and donned their equipment. At the time, the standby diver donned their wetsuit and prepared their dive equipment for immediate use if necessary. The topside supervisor and standby diver accompanied divers on the floating docks and passed wrapped timbers to them.

AECOM completed a dive log each time a diver entered and exited the water. Dive logs identify the duty of each personnel member and dive objective. Following each dive, divers communicated environmental conditions to the topside supervisor, including water depth, water temperature, current, visibility, and any findings. The dive log recorded each diver's time in, time out, air in (as measured by pressure readings in pounds per square inch [psi]), air out (psi), and maximum water depth. For the purpose of this project, due to the repeated ascents and descents and significant time spent at the surface, a full dive was considered from the time divers left shore to the time they returned to the egress point.

3.2 Pond Preparation and Geogrid Placement

AECOM scientific divers prepared the pond bottom approximately one week before the main timber preparation and ponding operations began. The geogrid material was a single-layer, bi-axial material, and sections were assembled on land by zip tying sections together. Each geogrid roll was approximately 250 ft long and 12 ft wide (76.2 m by 3.7 m). One section was rolled out to 100 ft and cut along the width. The process was repeated next to the first cut again, leaving approximately 50 ft (15.2 m) as spare material. The two 100-ft sections were then overlapped by approximately 6 in (15.2 cm) and double zip tied every 10 ft (3.0 m) (**Figure 8**). After assembly, each geogrid section was rerolled and floated into position before unrolling in the water and sinking. The corners of each mat were buoyed for later position recording, with each corner weighed down with cement blocks until timbers could be placed and secured.

Five geogrids measuring 100 ft long by 24 ft wide (30.5 m by 7.3 m). were placed on the pond bottom along an approximate north-south axis. A sixth section of geogrid, measuring approximately 92 ft long by 24 ft wide (28.0 m by 7.3 m) and created from assembling spare sections of geogrid, was placed along the northern border of the western-most three geogrids on an east-west axis. Finally, the corners of each geogrid were mapped with a Total Station.

Figure 8. Assembled geogrid material used to prepare Ben Brenman Pond bottom.

3.3 Timber Preparation and Transport

After pond bottom preparation, timbers were removed from the above ground pools and wrapped in a nonwoven, 120NM geofabric (**Figure 9**). Each timber was assigned a new unique identifier as it was prepared and wrapped. Most timbers were wrapped individually; however, those which were less bulky and similar in size, such as planking, were at times combined in bundles. Whether as an individual timber or multiple, each wrapped timber package was considered a bundle and given a unique identifier and tag linking it to each timber contained within. Each unique identifier used the Feature number and then the sequential bundle number following. Timbers associated with non-shipwreck features such as the Pioneer Mills wharfing used “X” as the feature number. Thus, for example, the unique bundle identifiers would look like 159-Bundle126 or X-Bundle19. As each timber was wrapped and bundled, data for each was input into a project-specific designed Fulcrum application, and chain of custody started. Each unique identifier tag was nailed into place after the bundle was wrapped using copper nails. Copper nails were used due to their chemically inert nature underwater and inability to alter timber chemistry. After each bundle was wrapped and tagged, they were transported to the pond on a trailer.

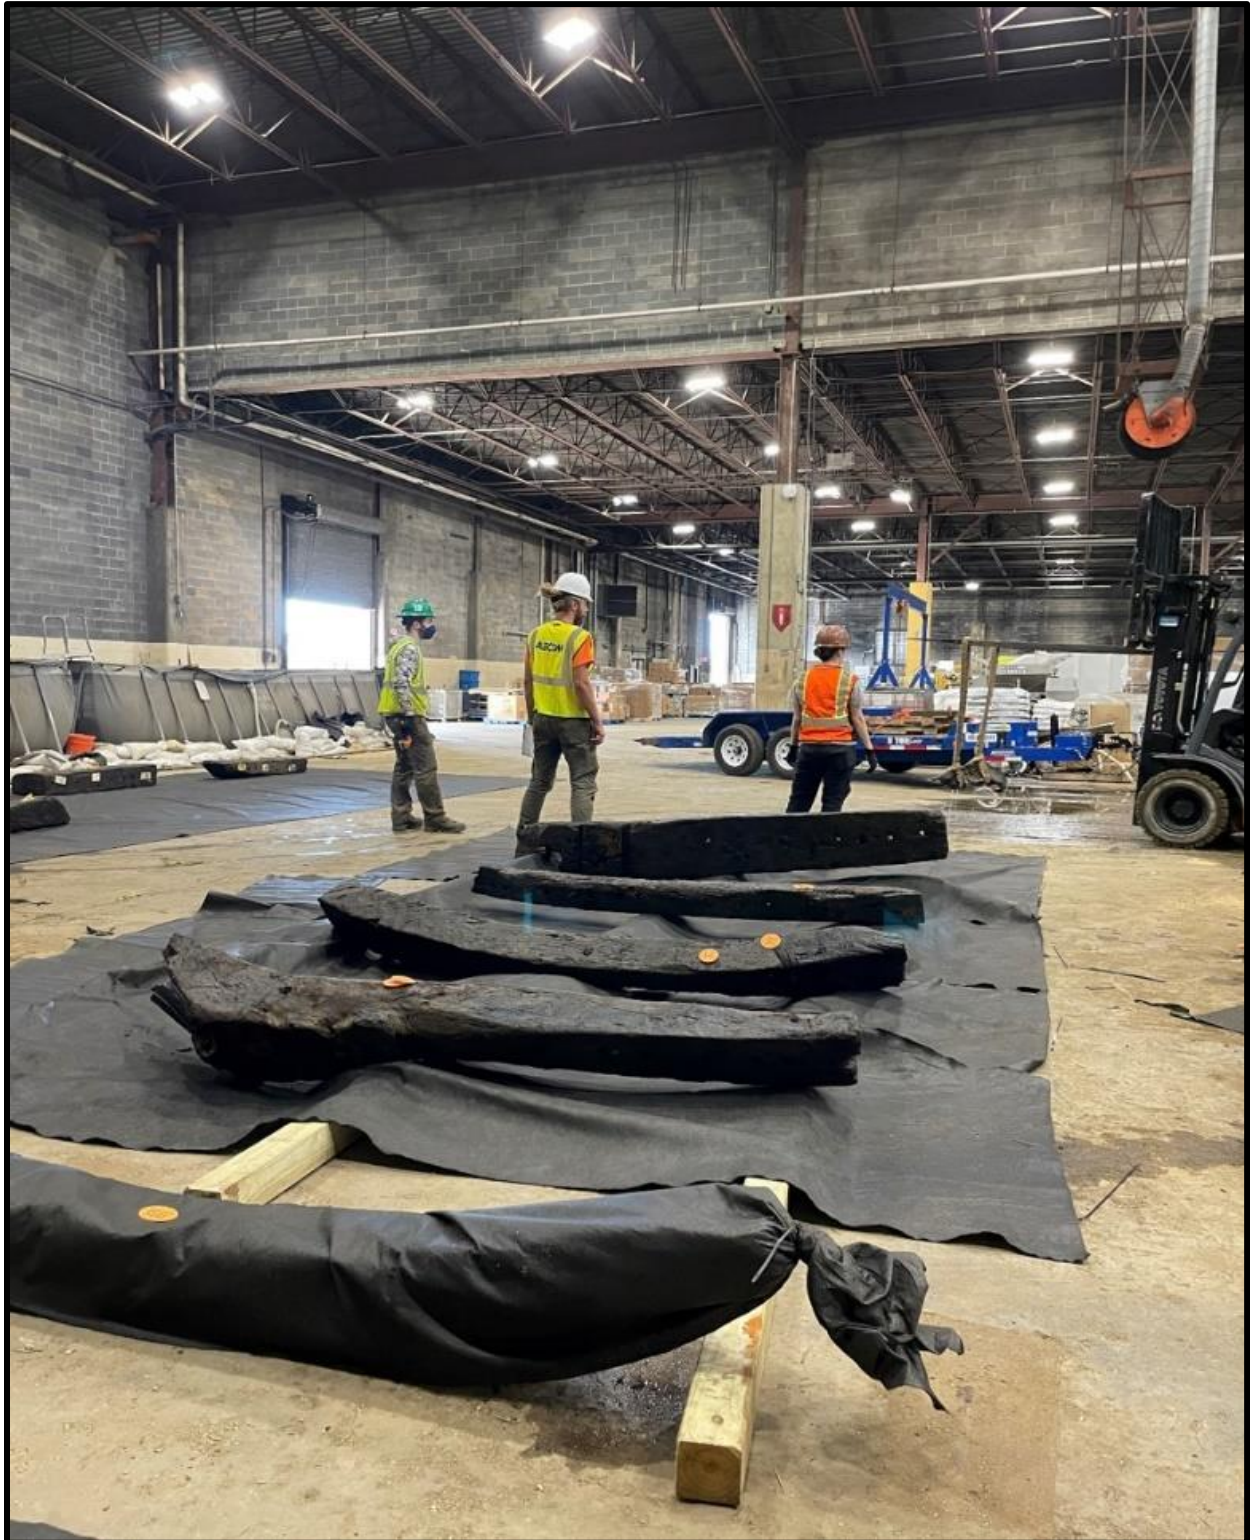

Figure 9. AECOM crews and City staff preparing the ship timbers in geofabric.

3.4 Timber Ponding

Ben Brenman Pond is located at the Ben Brenman Park Complex and is heavily trafficked by residents. In order to ensure public safety, due to the requirement to use a telehandler to maneuver larger or heavier timbers and the general project workspace needs, AECOM submitted a Modification to Traffic (MOT) plan to the City of Alexandria for approval. This plan saw the implementation of traffic control, including lane closures, re-routing pedestrian access to sidewalks in the work area, and project signage (**Figure 10**).

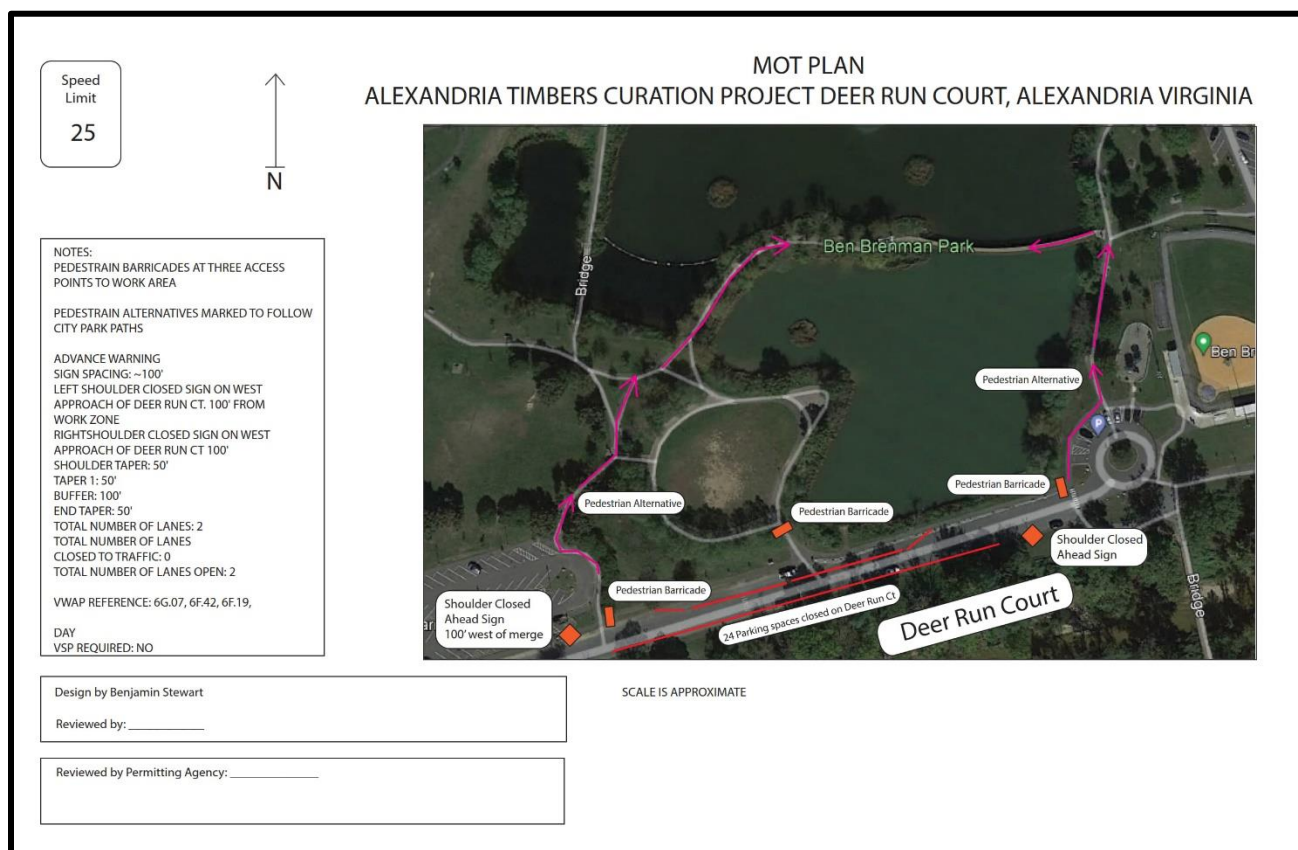

Figure 10. MOT Plan Submitted to the City of Alexandria.

After timbers arrived at the pond, chain of custody continued to ensure each timber bundle, and thus each timber, arrived at the pond. Following chain of custody data entry, each bundle was loaded onto a work barge. The barge consisted of two floating docks each measuring 10 ft by 5 ft (3.0 m by 1.5 m) connected via an A-frame windlass constructed of 2-inch by 4-inch (5 centimeter [cm] by 10.1 cm) lumber sections (**Figure 11**). Smaller bundles were loaded by hand or brought to the barge in large groups and transferred by hand. Larger timbers were hoisted and moved by the telehandler.

Smaller bundles were able to be loaded onto the barge decks. Longer or heavier timbers were strapped to side cleats with hoist straps or loaded within the windlass cradle and held in place by polypropylene rope. Following loading, the barge was then moved into the drop position by divers and anchored. Divers observed that while heavy out of the water, once entering the water, the timbers were much lighter and able to be maneuvered with general ease.

Once the barge was in position, large timber bundles were lowered first and placed adjacent to each other. Smaller bundles were used to fill in gaps between the larger timbers or abutted the larger timbers. All timbers were secured to the geogrid with heavy duty zip ties. Typically, each drop contained between 25-40 timber bundles. Divers worked in pairs, with the safety diver and dive supervisor present on the work barge during all dive operations. All necessary safety equipment was present onsite including emergency oxygen and portable AED. Diving pairs would switch shifts at midday. At the end of each workday, a daily report was prepared summarizing the number of bundles created, ponded, staff workers present at both work locations, and any pertinent notes. These are included in **Appendix A**.

Dive statistics were recorded throughout the day and compiled at the end of each day by the project Dive Safety Officer. For the purposes of this project, a full dive was considered from the time the barge left the loading area until the barge returned to the loading area. This meant that dive times included significant amounts of time where divers would be discussing plans at the surface before descending with the first drop.

Between five and six timber bundles from each shipwreck were chosen for future monitoring. All monitoring bundles were designated with flagging tape and placed in the same location, adjacent to each other. A buoy was then affixed adjacent to their position and tied off so that it is approximately two ft (0.6 m) below the water surface. Measurements were taken to each monitoring buoy from the southeastern corner of their respective grids for future monitoring dives.

Figure 11. Project Work Barge Configuration.

4. Project Results

Between 2 May 2022 and 26 May 2022, AECOM staff created 803 bundles including 1,219 timbers from Features 200 (Ship 1), Feature 155 (Ship 2), Feature 159 (Ship 3), and timbers associated with other wharf features excavated from 44AX235, including Pioneer Mills. AECOM successfully relocated 769 of the bundles including 1,185 ship timbers from the City warehouse to Ben Brenman Pond. A total of 20 bundles consisting of 20 individual timbers were intentionally kept by Alexandria Archaeology for conservation. A total of 14 bundles consisting of 14 individual timbers were unable to be ponded and were returned to the City warehouse. These timbers could not be ponded due to the levels of degradation and waterlogging; these factors combined to make the timbers positively buoyant. AECOM attempted to secure these timbers to the bottom by attaching them to heavier timbers and anchoring them with cinder blocks. Two attempts were made with the timber breaking the heavy-duty zip ties and returning to the surface. Following the second attempt, the potential for diver injury was deemed too great and any of the timbers that floated on the surface before loading on to the barge were then returned to the City warehouse for storage. **Appendix B** contains the Timber Catalog, which details each bundle, the associated timbers, and onto which geogrid they were placed.

Prior to the ponding project, the City had created 3-dimensional (3D) scans of all the timbers and developed a list of all timbers within the collection. There are discrepancies between the list of timbers recovered from excavations, list of timbers 3D scanned, and list of timbers that were ponded. The differences between the lists are likely due to several reasons. First, many of the timbers are both large and fragile, therefore making them prone to breaking into multiple pieces over time. Secondly, the timbers vary in their levels of preservation. This means that some artifact tags that were once attached and recorded in the field may have fallen off during the four years between excavation and ponding. Third, timbers were originally labelled with permanent marker on Tyvek. Mildew and other staining agents inherent to the timbers, such as iron sulfides) may have obscured the original labels and made them difficult to accurately read. Finally, when excavating, 3D scanning, and ponding, crews needed to work quickly to remain on schedule, leading to potential transcription errors.

The number of timbers not located at the time of ponding and the number of records added appear to be similar in nature, indicating that no major portions of the collection were lost over the four years between excavation and ponding. The discrepancies between collection lists are clerical in nature and not a result of missing artifacts. For example, Feature 159 (Ship 3) had a total of 73 records added. Of the original timbers excavated, 64 were not accounted for. This suggests the newly added timbers account for those 64 which were not located. Those timbers that were not found may have lost their tag or were incorrectly recorded at either the time of excavation or ponding.

4.1 Diving Conditions

Pond bottom conditions varied during dive operations. A layer of organic silt approximately 8 to 12 in (20.3 to 30.5 cm) deep overlaid natural sediments. Thus, visibility ranged from 2 ft (0.6 m) before disturbance to 0 in (0 cm; no visibility, black water) after disturbance. Water depth was between 7-7.5 ft (2.1-2.3 m). No major bottom obstructions such as debris were encountered by divers. Water temperatures ranged between 63-68°F (17.2-20°C), which necessitated that divers work in dry suits, per AECOM diving safety protocols. As sediments from the organic silt layer settled over the course of the project, a thin layer of silt covered both the geogrid and timber fabrics by the final dive day (**Figures 12 and 13**). In total, divers completed 128 hours of diving over the course of 17 working days. Restrictions to diving due to inclement weather occurred only once, requiring divers to exit the water approximately two hours early.

Diving conditions remained similar during monitoring dives with the exception that water temperatures reached 75°F (23.9°C). Divers completed 5.5 hours of diving.

4.2 Timber Placement

Four of the six geogrids placed on the pond bottom were used to secure timbers. They are designated as Grids Ship 1-A, Ship 2-A, Ship 3-A, and Ship 3-B (**Table 1; Figures 14 and 15**). Feature 200 included a total of 235 timbers, Feature 155 included a total of 226 timbers, and Feature 159 included a total of 720 timbers. Timbers from additional features such as wharves included 22 timbers.

Grid Ship 1-A included all timbers from Feature 200 in the northern portion of the grid. Additionally, the southern 25 ft of Grid-Ship 1-A includes timbers associated with Feature 155 and non-ship remnant features. It was decided in the field that there were not enough remaining timbers from the latter two to justify the use of an entire new geogrid. Fifteen feet (4.6 m) of empty geogrid material separate Features 155 timbers from Feature 200 on the pond bottom (see **Figure 15**). In total, 235 timbers from Feature 200 contained in 120 bundles, 20 timbers from Feature 155 contained within 19 bundles and nine timbers from non-ship remnant features contained within nine bundles were secured to Grid Ship 1-A. Monitoring timbers from Feature 200 are located 41 ft (12.5 m) north of the grid's southeast corner, along the grid's eastern edge. Monitoring bundles include 200-Bundle14, 200-Bundle53, 200-Bundle75, 200-Bundle86, and 200-Bundle102, consisting of five timbers in total for future condition monitoring (**Table 2**).

Due to the buoyant nature of the geogrid material, as divers were placing timbers for Feature 159, they observed that portions of Grid Ship 1-A had shifted and overlapped Grid Ship 3-A. The overlap is minor and did not require removing timbers to readjust the geogrid material. The overlap is depicted on Figures 13 and 14 and is based on diver observations. The overlap occurred before timbers were placed on the geogrid matting. With the weight of the timbers securing the geogrid to the pond bottom, no further geogrid movement is anticipated.

Grid Ship 2-A includes most of the timbers from Feature 155 in addition to wharf remains associated with other features at 44AX235. In total, Grid Ship 2-A contains 203 timbers from Feature 155 contained in 170 bundles and 13 wharf timbers contained within 13 bundles were secured to Grid Ship 2-A. Monitoring timbers for Feature 155 are located at the southeast corner of Grid Ship 2-A, 30.5 ft (9.3 m) northwest from the northeast corner of the pond spillway. Monitoring bundles include 155-Bundle28, 155-Bundle59, 155-Bundle87, and 155-Bundle171. Additionally, one bundle from the non-ship remnant features was selected to accompany the Feature 155 monitoring bundles. The was bundle X-Bundle21 (**Table 2**). In total, the monitoring bundles on Grid Ship 2-A include four timbers from Feature 155 and one from non-ship remnant features.

Finally, Grids Ship 3-A and Ship 3-B include all timbers associated with Feature 159. Grid Ship 3-A contains 367 timbers from Feature 159 contained in 243 bundles and Grid Ship 3-B contains the remaining 338 timbers contained in 195 bundles. Finally, monitoring timbers for Feature 159 are located 7 ft (2.1 m) north from the southeast corner of Grid Ship 3-B. Monitoring bundles include 159-Bundle23, 159-Bundle51, 159-Bundle68, 159-Bundle256, and 159-Bundle285, consisting of five timbers in total for future condition monitoring (**Table 2**).

Archaeologists from the City of Alexandria retained 20 bundles containing 20 timbers for conservation. These included five bundles containing five timbers from Feature 200, three bundles containing three timbers from Feature 155, 10 bundles containing 10 timbers from

Feature 159, and two bundles containing two timbers from non-ship remnant features. Of the 14 timbers unable to be ponded and returned to the City warehouse, five bundles containing five timbers were from Feature 159, and nine bundles containing nine timbers were from non-ship remnant features.

Originally, the project plan included creation a site plan map of the arrangement of the bundles within each grid. Due to the blackwater conditions in the pond and the inability to read line measurements or locate bundle tags without visual confirmation, these plans were adjusted in the field. Additionally, due to the buoyant nature of the geogrid material, in areas where there was overlap at Grids Ship 1-A and Ship 3-A, divers would not have been able to determine the Feature to which individual bundles belonged to. There was a distinct possibility given the dive conditions that a single bundle may have been misidentified several times and mapped incorrectly multiple times, leading to a highly inaccurate plan map. Thus, a full schematic drawing of the site with every timber individually drawn in was determined to be impractical at the time of ponding operations. To mitigate the lack of a full site map of the timbers as they lie at the pond bottom, AECOM recorded which geogrid each timber bundle was secured to in the chain of custody notes for each timber bundle. For Grid Ship 1-A, AECOM divers measured the distances from the southern edge of the geogrid material to the northern edge of the timbers associated with Feature 155 and to the edge of empty matting between timbers from Feature 200 and 155. These data allowed for a general site map to be created and each timber to be tied to specific geogrid.

The unused geogrids were pulled from the pond bottom in addition to all cement blocks used as temporary anchors.

Table 1: Coordinates of Ship Grid Corners (given in NAD83 Virginia State Plane North Feet, X/Y)

Ship Grid	Northeast Corner	Southeast Corner	Southwest Corner	Northwest Corner
Ship 1-A	11877923/ 6980321	11877916/ 6980238	11877892/ 6980236	11877898/ 6980323
Ship 2-A	11877950/ 6980321	11877941/ 6980228	11877918/ 6980234	11877927/ 6980323
Ship 3-A	11877895/ 6980280	11877897/ 6980194	11877870/ 6980192	11877871/ 6980281
Ship 3-B	11877870/ 6980282	11877868/ 6980192	11877844/ 6980192	11877846/ 6980286

Table 2: Coordinates of the Monitoring Bundles (given in NAD83 Virginia State Plane North Feet, X/Y)

Ship Grid	Feature	Bundles Included	Bundle Coordinates
Ship 1-A	200	200-Bundle14, 200-Bundle53, 200-Bundle75, 200-Bundle86, 200-Bundle102	11877919/ 6980279
Ship 2-A	155	155-Bundle28, 155-Bundle59, 155-Bundle87, 155-Bundle171, X-Bundle21	11877941/ 6980228
Ship 3-B	159	159-Bundle23, 159-Bundle51, 159-Bundle68, 159-Bundle256, 159-Bundle285	11877869/ 6980199

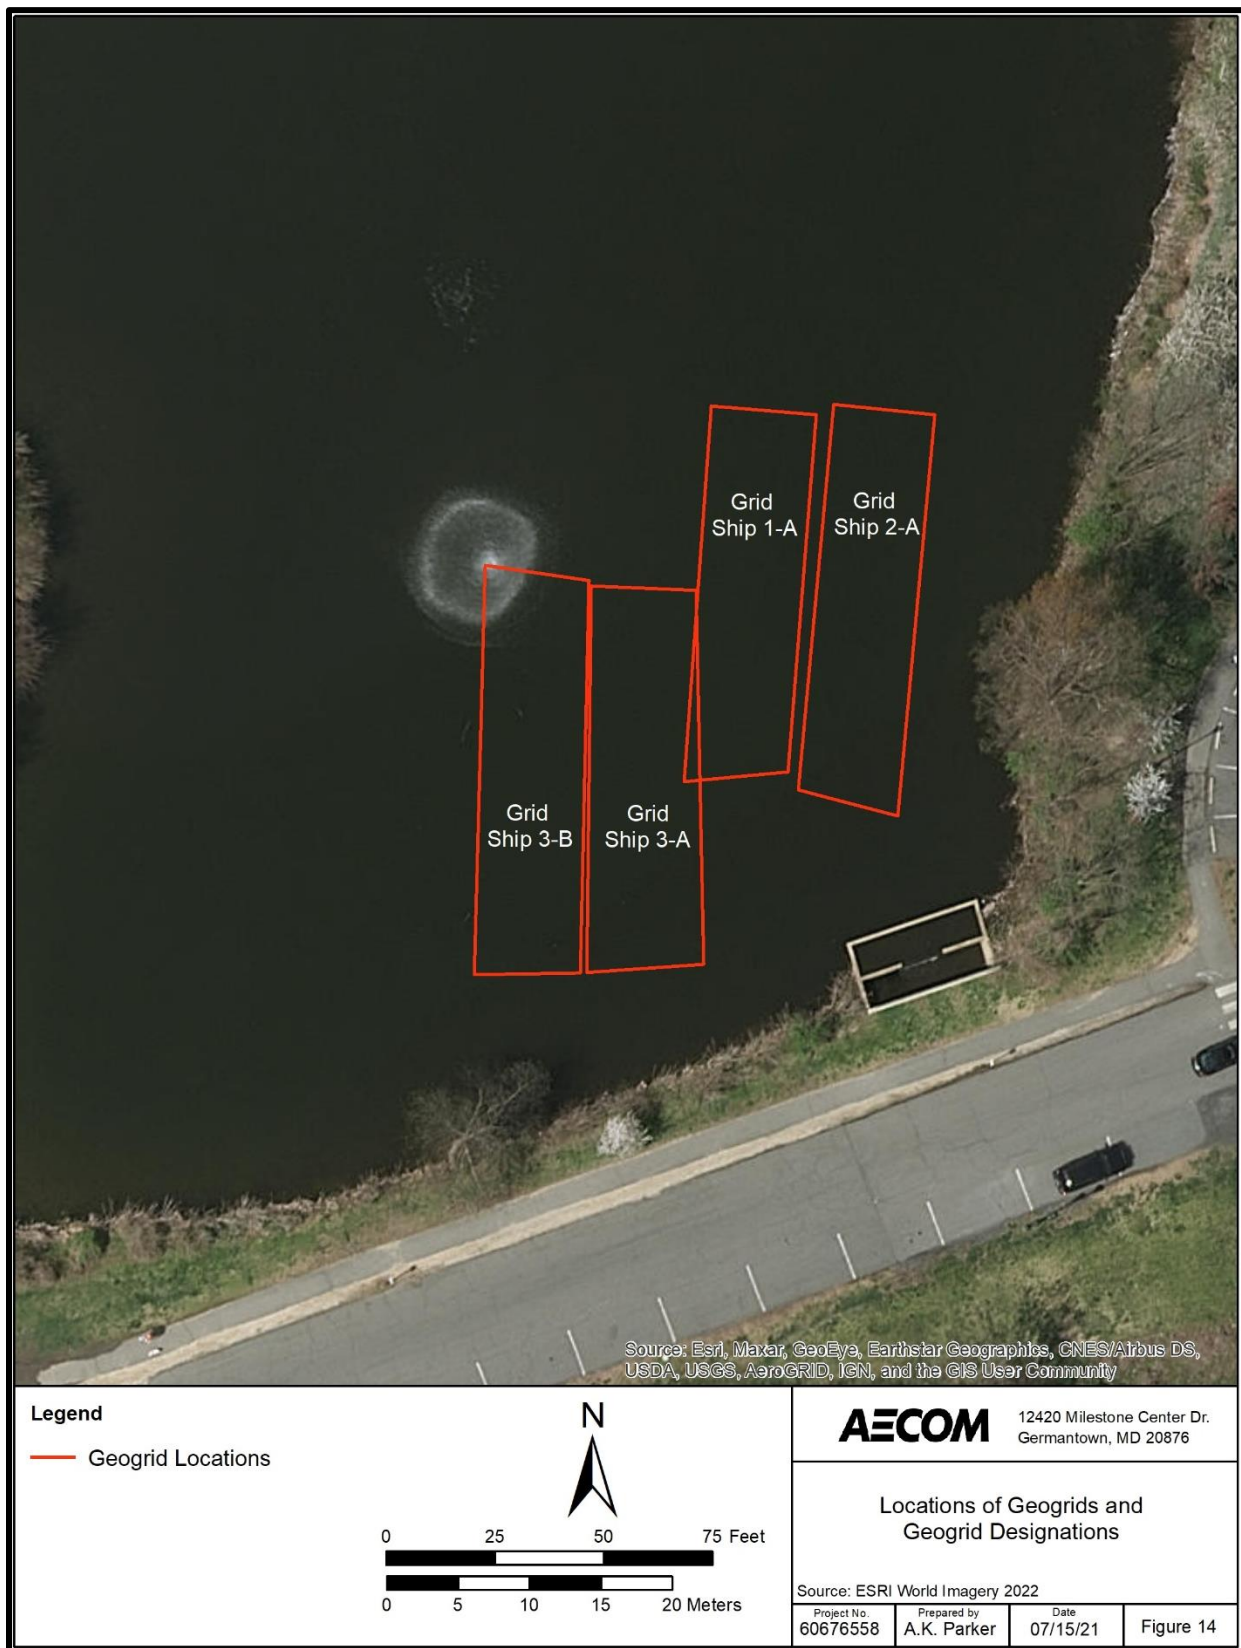

Figure 14. Location of geogrids and geogrid designations.

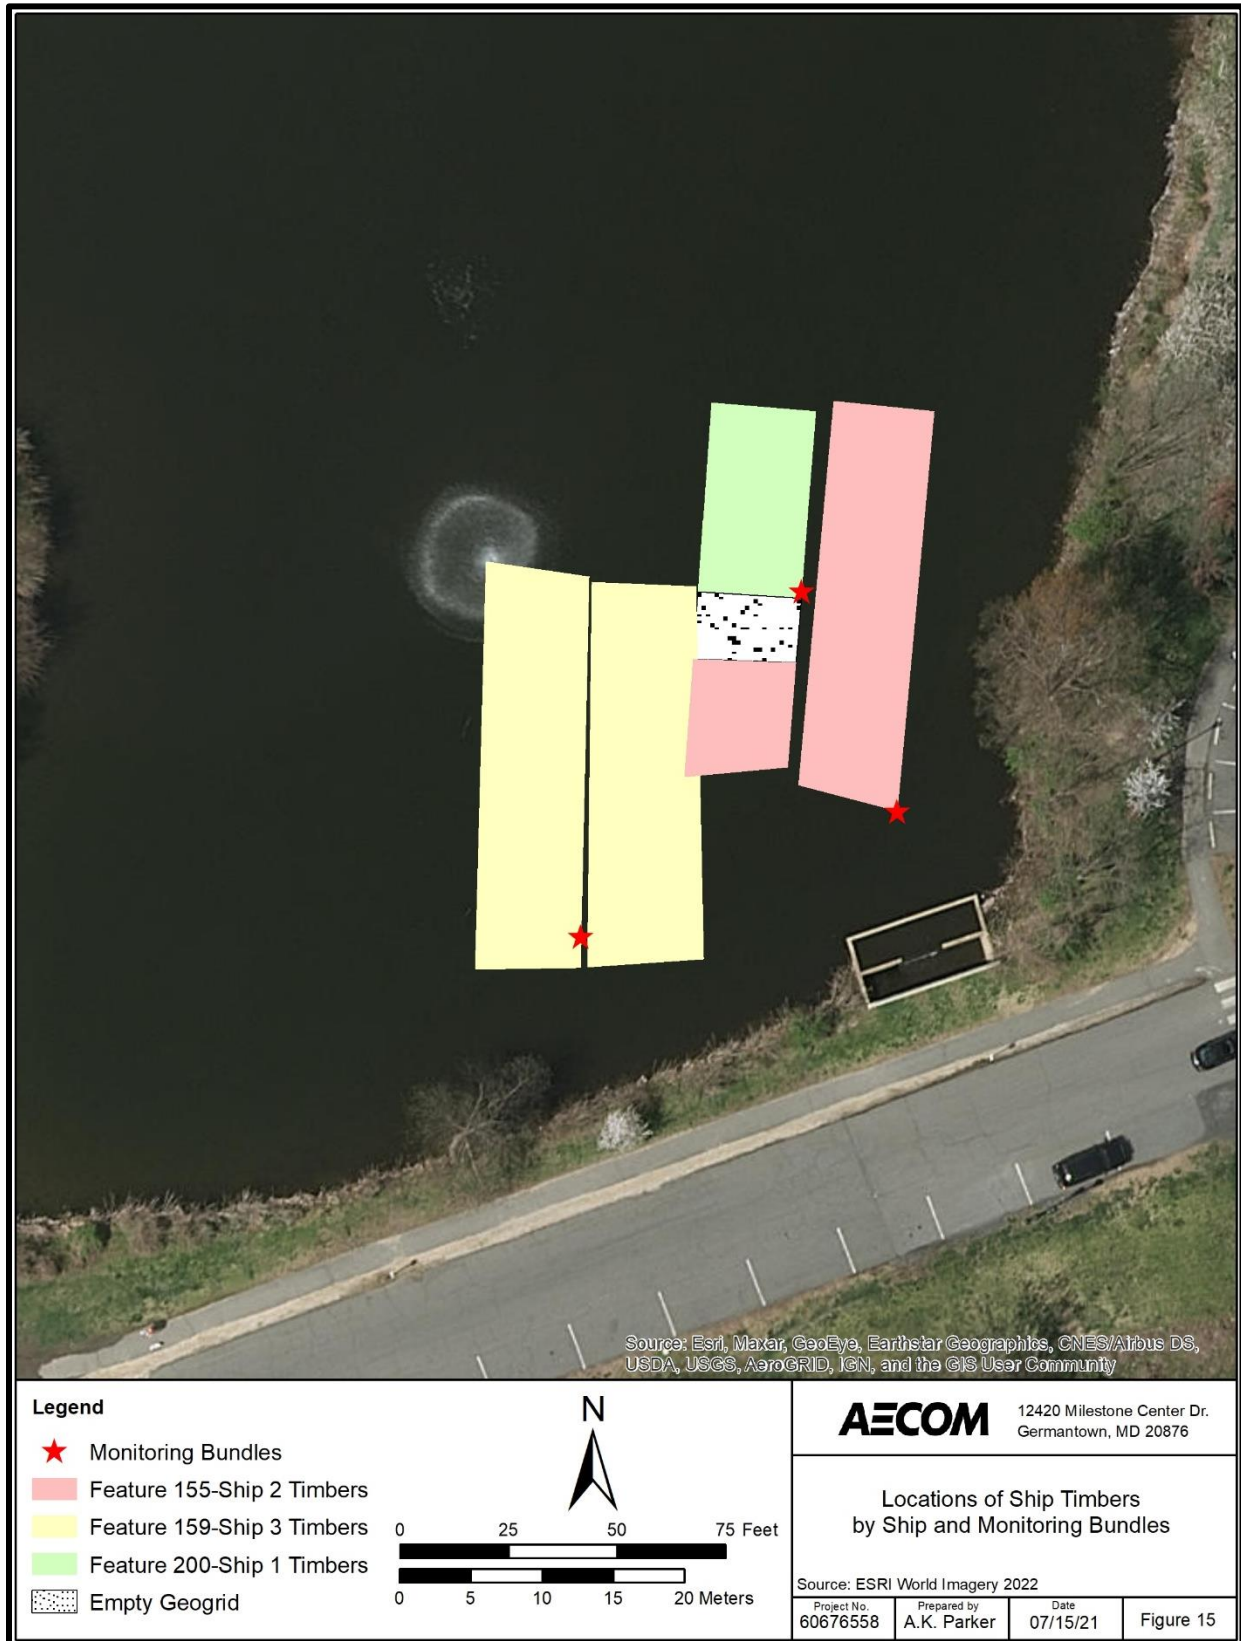

Figure 15. Locations of ship timbers and monitoring bundles within the project geogrids.

The final data have been provided to the City as two Excel spreadsheet (.xlsx) files. The file “Timbers_Catalog_20220721” includes all original data provided by the City in addition to the date of inventory by AECOM, associated Bundle ID, other notes, a general final location of the timber, and the unique ID fields used during the move. Those timbers listed as “Not inventoried” were unable to be clearly identified during the ponding process but may be represented by other records in the table. AECOM has rectified them as closely as possible with the data provided. The file “Bundle_Catalog_20220721” includes all relevant information about each bundle, its contents, final location (including grid within the pond), complete chain of title for the ponding process, and any additional notes.

As depicted on Figures 13 and 14, a pond aerator has previously been situated near the northwest corner of Grid Ship 3-B. It is highly recommended that the pond aerator be situated away from the ponded timbers to help maintain their medium-term stability.

4.3 Year 1 Condition Monitoring

On 8 June 2023, AECOM performed eight dives to support the initial monitoring of the timbers. Fieldwork included pulling all monitoring timbers: 155-Bundle28, 155-Bundle59, 155-Bundle87, 155-Bundle171, 159-Bundle23, 159-Bundle51, 159-Bundle68, 159-Bundle256, and 159-Bundle285, 200-Bundle14, 200-Bundle53, 200-Bundle75, 200-Bundle86, 200-Bundle102, and X-Bundle21. After each timber was pulled, archaeologist for the City, Tatiana Niculescu, PhD, and Nichole Doub of MACL performed a series of tests (detailed below) to determine the stability of the timbers. After these tests, each timber was replaced in its original position adjacent to the marker buoy, and AECOM divers performed visual observations of the remaining timbers and site to determine the site stability and condition.

In order to relocate the monitoring bundles, AECOM used the measurements from the southeast corner of each geogrid described above in Section 4.2 and displayed in Figure 15. After relocating the marker buoys suspended below the water line, divers deployed a temporary surface marker buoy. One diver would remain at the bottom to find each timber bundle while a second diver remained at the surface with the safety diver and a single 10 ft by 5 ft (3.0 m by 1.5 m) floating dock. The working diver cut the original heavy duty zip ties securing the bundles to the geogrid and signaled the second diver to come retrieve the timber bundle. After returning to the surface, the second diver assisted the safety diver getting the timber aboard the dock. After all monitoring timbers were retrieved from a geogrid, they were brought ashore, and divers returned to the pond for the next group. AECOM relocated all 15 monitoring bundles.

For timber testing, measurements were taken on the wood’s material strength in order to determine if the wood was degrading significantly or remaining stabilized in the pond environment. Originally, conservators had intended on taking measurements using a penetrometer to give quantitative measurements; however, wood density exceeded the ranges typically encountered by the device. Instead, conservators used a 4-in (10.1-cm) metal needle to assess wood strength based on a scale measuring the needle’s penetrative depth:

- 1- greater than 40 millimeters (mm, 1.57 in)
- 2- 30-40 mm (1.18-1.57 in)
- 3- 20-30 mm (0.79-1.18 in)
- 4- 10-20 mm (0.39-0.79 in)
- 5- 2-10 mm (0.09-0.39 in)
- 6- 0-2 mm (0-0.09 in)

According to the scale above, a rating of 6 indicated the highest level of preservation with virtually no degradation whereas a rating of 1 indicated the lowest level of preservation and significant degradation (Doub 2023). Penetrative tests were performed at several points along each surface of the monitoring timbers, and these data were input into a Fulcrum application designed specifically for the monitoring fieldwork. Overall conditions of the timbers are found in **Table 3** and field notes from monitoring are found in **Appendix D**. In addition to the tests, each timber was photographed before being rewrapped in geofabric and the ends again zip tied and marked with flagging tape.

Table 3. Condition testing results for the monitoring bundles.

Feature	Bundle	Timber	Overall Condition Rating	Notes
155	28	F7-2E	Variable 4-6	End with dorsal cut is a 4. End with trunnel is a 6.
155	59	F31-2E	5	Localized areas are 4. Concretions on surface measure 0.35 in wide by 0.25 in long (0.63 by 0.89 cm)
155	87	PE 1-1.3	5	Can get needle into surface but not deeper.
155	171	K 4	3	One side very soft; one large concretion on surface measuring 0.4 in wide by 0.3 in long (0.76 by 1.01 cm)
159	23	520-F2S	5	Overall, timber is a 5 with ratings of 3 found along lateral and end surfaces
159	51	F24-F2S	5	Overall, timber is a 5 with areas on the dorsal surface and one lateral surface rated as 4, particularly where teredo worm damage is visible.
159	68	F48-F2N	5	Overall, timber is a 5 with some areas rated as 4, especially along end surfaces.
159	256	PN 2.3	6	Overall, timber is a 6 with some areas rated as 5. Two cracks were observed on the ends, one measuring 2.9 ft long (0.89 m) and the other measuring 0.9 ft (0.27 m)
159	285	PN 1-1.1	6	Overall, timber is a 6 with localized areas rated as 4 found along squared end
200	14	F14-2N	3	Overall, timber is a 3 with localized areas having harder surfaces
200	53	F1-0.1	6	Overall, timber is a 6 with localized areas rated as a 5
200	75	F13-2N	Variable 3-6	Dorsal and ventral sides measure 5 or 6, while lateral sides rated as 3 or 5.
200	86	PN 8-1	6	Overall, timber is a 6 with some areas measuring 4 or 5 spread along timber surface
200	102	PN 1-3	6	Overall timber is a 6. Middle section is a 5 with some areas of 4 along the terminal end
X	21	CN 4 (west)	4	Surface is soft but core is very solid

Overall notes about the bundles include that both the geofabric and zip ties were in good condition. All timbers were in good shape with no substantial concerns regarding degradation. After testing, divers reversed the procedure for bringing the monitoring bundles to the surface in order to re-secure them to the geogrid. All monitoring timbers were replaced in their original positions.

After the timbers were replaced in their original locations, divers completed two dives to evaluate the remainder of the timbers and the site conditions. Divers observed that geogrid material was covered by approximately 1.0-2.0 in (2.5-5.0 cm) of silt. Geofabric was covered by an average of 0.04-0.08 in (1.0-2.0 mm) of silt, with a maximum of 0.2 in (5.0 mm) of silt coverage. Almost all cattle tags were covered and not immediately visible. It is anticipated that silt will continue to accumulate and create an anaerobic environment to assist with timber preservation.

Geogrids and their anchors had not moved, and all heavy-duty zip ties were in excellent condition. There are some slight billows in the geogrid material, but no more than remained after the initial ponding. Green and blue algae have started to cover any exposed geogrid materials and, to a lesser degree, the geofabric. Algae growth appeared to be more prevalent on the northern (deeper) end of the geogrids. This is potentially due to deeper environments less affected by rain and wildlife variables. Future monitoring dives are anticipated to occur in early Spring 2028.

4.4 Reporting

AECOM recorded the location of the ponded timbers as an archaeological site with the Virginia Department of Historic Resources, separate from that of 44AX235. Final review of the site form was completed on 27 July 2022, and the timbers at Ben Brenman Pond were assigned the site trinomial 44AX253 (**Appendix C**). This report is an updated revision to the original interim report for the purpose of adding data collected during the initial monitoring dives.

Staff and visitors present at pond [Name (Affiliation)]	Adam Parker (AECOM), Ashley Matthews (AECOM), Chris Marshall (AECOM), James Salafia (AECOM)
Notes	Today the scientific dive team began planning laying geogrids to prepare the pond bottom and do pre dive recon of the pond shoreline. Following this, the dive team met with T. Niculescu and E. Breen at the city bus garage to assess geogrid sizing and quantity of timbers per ship. After meeting with city archeologists, the crew verified the delivery of cinder blocks to Ben Brenman Pond. Team members then visited dive shop to secure final equipment needs. Finally, dive team returned to dive HQ for internal planning and review of dive ops plan. B. Stewart dropped off additional equipment from Gaithersburg warehouse. No timbers, bundles, or grogrids were placed in pond today

Staff and visitors present at pond [Name (Affiliation)]	Adam Parker (AECOM), Ashley Matthews (AECOM), Ben Stewart (AECOM), Chris Marshall (AECOM), James Salafia (AECOM), Tatiana Niculescu (City of Alexandria), Jamal, CoA safety observer
Notes	<p>Today, dive team retrieved geogrid material from the city bus garage and began assembling geogrids on-site at Ben Brenman Pond. B. Stewart and A. Parker traveled to Gaithersburg to pick up floating dock sections while the other dive team members assembled geogrid sections. A total of 5 geogrids measuring 100 x 24 feet and 1 measuring 90 x 24 feet were assembled. A total of 0 geogrids were laid on the pond bottom today however all are ready to be laid on the pond bottom</p> <p>Each roll of geogrid material is 12 x 246 feet. Each roll was rolled out 100 feet and cut width wise. The process was repeated. The two 100 foot long rolls were then overlapped by 4 "grid squares" and zip tied twice every 5 feet along the seam. The remaining 46 feet of material from four rolls was used to assemble the 6th, smaller roll noted above using the same seam and zip tie method</p>

Notes	The scientific dive team focused on staging the project's floating docks and prepping buoys for the geogrids in the morning. At 1126 C. Marshall and A. Matthews performed dive to place buoys for the southern east- west axis of the timber laying area to guide unrolling the prepared geogrids. J. Safalia acted as safety diver. At 1230, divers exited the water after placing cinder blocks on south side of first geogrid. In the second half of the day, divers continued laying geogrids and weighing them down to the pond bottom. The same diver rotation positions were used. Divers entered the water at 1515 and exited at 1750. A total of 2 geogrids were placed in the pond today.

Notes	Today the scientific dive team laid 3 more geogrids without incident. A. Matthews and J. Safalia were scientific divers and A. Parker acted as safety diver. At the warehouse, teams went over the warehouse order of operations. Diver A. Parker had dry suit neck seal issues and A. Matthews filled in. Additionally, they tested wrapped some timbers.

Sign-in sheets

AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis, amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- * The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- * The hazards & control measures associated with each task you are about to perform.
- * The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- * That no tasks or work is to be performed without a hazard assessment.
- * Your authority & obligation to "Stop Work" intervene, speak up! listen up.

Your initials (sign column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- * You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- * You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- * You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/talpa issue to the AECOM Supervisor.
- * You signed out as fit/uninjured unless you have otherwise informed the AECOM Supervisor.

Sign-in sheets

AECOM
AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- The hazards & control measures associated with each task you are about to perform.
- The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- That no tasks or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" intervene, speak up / listen up.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment of your issue to the AECOM Supervisor.
- You signed out as fit/uninjured unless you have otherwise informed the AECOM Supervisor.

Sign-in sheets

AECOM

All employees:

- **STOP WORK** if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- The hazards & control measures associated with each task you are about to perform.
- The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- That no tasks or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" intervene, speak up / listen up.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/talque issue to the AECOM Supervisor.
- You signed out as fit / unimpaired unless you have otherwise informed the AECOM Supervisor.

Sign-in sheets

AECOM

AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- The hazards & control measures associated with each task you are about to perform.
- The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- That no task or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" whenever a "speak up" takes place.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/fatigue issue to the AECOM Supervisor.
- You signed out as fit / unassigned unless you have otherwise informed the AECOM Supervisor.

Sign-in sheets

AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- The hazards & control measures associated with each task you are about to perform.
- The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- That no task or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" intervene, speak up, listen up.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/frustration issue to the AECOM Supervisor.
- You signed out as fit / unfit/uninjured unless you have otherwise informed the AECOM Supervisor.

Sign-in sheets

AECOM **COM**

All employees:

- **STOP WORK** if concerned / uncertain about safety / hazard or additional precaution is not recorded on the TMA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis, among the TMA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in training, reviewing, & updating hazard assessments (THA) applicable to your tasks.
- The hazards & control measures associated with each task you are about to perform.
- That no task or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" intervene, speak up, listen up.

Your initials (sign column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/fatigue issue to the AECOM Supervisor.
- You signed out as fit, unless you have otherwise informed the AECOM Supervisor.

AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- * The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- * The hazards & control measures associated with each task you are about to perform.
- * The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities)
- * That no tasks or work is to be performed without a hazard assessment.
- * Your authority & obligation to "Stop Work" intervene, speak up, listen up.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- * You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- * You are not under the influence of any type of medication, drugs, or alcohol that could effect your ability to work safely.
- * You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or employment/fatigue issue to the AECOM Supervisor.
- * You signed out as fit / uninvolved unless you have otherwise informed the AECOM Supervisor.

AECOM

All employees:

- STOP WORK if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.
- Reassess task, hazards, & mitigations on an ongoing basis; amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your task(s).
- The hazards & control measures associated with each task you are about to perform.
- The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- That no task or work is to be performed without a hazard assessment.
- Your authority & obligation to "Stop Work" whenever, speak up, listen up.

Your initials (right column) certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/fatigue issue to the AECOM Supervisor.
- You signed out as fit/unique unless you have otherwise informed the AECOM Supervisor.

AECOM

All employees:

- **STOP WORK** if concerned / uncertain about safety / hazard or additional precaution is not recorded on the THA.
- Be alert and communicate any changes in personnel or conditions at the worksite to the supervisor.

Business task: hazards, & mitigations on an ongoing basis, amend the THA if needed.

SITE WORKERS (including AECOM Contractors and Subcontractors): Your signature below means that you understand:

- * The requirement to participate in creating, reviewing, & updating hazard assessments (THA) applicable to your activity.
- * The hazards & control measures associated with each task you are about to perform.
- * The permit to work requirements applicable to the work you are about to perform (if it includes permitted activities).
- * That no task or work is to be performed without a hazard assessment.
- * Your authority & obligation to Stop Work (permitted) until you follow up.

Your initials right column certify that you arrived & departed fit for duty, & have reported all incidents/near misses, meaning:

- * You are physically and mentally fit for duty and have inspected your required PPE to ensure satisfactory condition.
- * You are not under the influence of any type of medication, drugs, or alcohol that could affect your ability to work safely.
- * You are aware of your responsibility to immediately report any illness, injury (regardless of where or when it occurred), or impairment/fatigue issue to the AECOM Supervisor.
- * You signed out as fit / unharmed unless you have otherwise informed the AECOM Supervisor.

Staff and visitors present at warehouse [Name (Affiliation)]	Alex Dorosin (AECOM), Ben Stewart (AECOM), Charles Simpson (AECOM), Collin Strine-Zuroski (AECOM), Luka Eglesia (AECOM), Raymond Baird (AECOM), Tatiana Niculescu (City of Alexandria), Travis Corwin (AECOM)
Staff and visitors present at pond [Name (Affiliation)]	Adam Parker (AECOM), Alex Dorosin (AECOM), Ashley Matthews (AECOM), Ben Stewart (AECOM), Charles Simpson (AECOM), Chris Marshall (AECOM), Collin Strine-Zuroski (AECOM), Eleanor Breen (City of Alexandria), John Sottile (Connelly), Luka Eglesia (AECOM), Raymond Baird (AECOM), Travis Corwin (AECOM)
Contractors present [Name (Company)]	John Sottile (Connelly)
Notes	Today was the major demob day and pond clean up. After meeting at the warehouse, the warehouse crew came out to the pond to assist with pond demob. Buoys at the corners of geogrids were removed at buoys at monitoring bundles were placed under water by about 2 feet. All geogridding not used has been pulled up.

2022-05-26

Updated	2022-05-31 13:07:22 UTC by Mike Carr
Status	■ Daily Report
Date	2022-05-26
Date String	5/26/22
Total bundles created today	0
Total units placed in pond today	0
Staff and visitors present at pond [Name (Affiliation)]	Adam Parker (AECOM), Ashley Matthews (AECOM), Chris Marshall (AECOM), Pete Wray (aecom)
Notes	One last dive was made on site to demonstrate aecom scientific diving protocols to aecom regional safety manager and to attempt to get images and video of timber conditions on the bottom. Both objectives were a success. Final demob and equipment packing followed and dive gear rental equipment return.

This Page Intentionally Blank

Snapshot

Date Generated: June 23, 2023

Site Name: Robinson Terminal Shipwrecks
Site Classification: Submerged
Year(s): No Data
Site Type(s): Shipwreck, Shipwreck, Shipwreck
Other DHR ID: No Data
Temporary Designation: Robinson Terminal Shipwrecks

Site Evaluation Status

Not Evaluated

Locational Information

USGS Quad: ALEXANDRIA
County/Independent City: Alexandria (Ind. City)
Physiographic Province: Coastal Plain
Elevation: No Data
Aspect: No Data
Drainage: Potomac
Slope: No Data
Acreage: 0.220
Landform: Urban
Ownership Status: Local Govt
Government Entity Name: No Data

Site Components

Component 1

Category: Transportation/Communication
Site Type: Shipwreck
Cultural Affiliation: Euro-American
Cultural Affiliation Details: No Data
DHR Time Period: Colony to Nation, Early National Period
Start Year: No Data
End Year: No Data
Comments:
Ship 2 was originally recorded as Feature 155 at Site 44AX235. It is a mid to late 18th century sloop shipwreck used for shoreline expansion. The vessel remains were excavated in 2018 and underwent short term preservation at the Alexandria City Bus Barn. Following short-term preservation and data collection, the vessel remains were wrapped in geofabric, transported, re-submerged, and secured to geogrid material at the bottom of Ben Brenman Pond, in the City of Alexandria.

A total of 223 timbers contained within 189 bundles were secured to the pond bottom. Of these, 203 timbers contained within 170 bundles are located on geogrid Ship 2-A and 20 timbers contained within 19 bundles are located at the southern end of geogrid Ship 1-A.

Transport and submersion occurred in May 2022. The timbers took up approximately 1.25 100x24-foot (30.5x7.3-meter) geogrids. Timbers selected for periodic monitoring dive assessments were placed at the southeast corner of geogrid Ship 2-A, approximately 30.5 feet (9.3 meters) northwest of the northeast corner of Ben Brenman Pond's spillway to Cameron Run. Monitoring bundles include 155-Bundle28, 155-Bundle59, 155-Bundle87, and 155-Bundle171.

Feature 155 occupies the eastern-most geogrid and the southern portion of the geogrid it shares with Feature 200. Substantial empty geogrid material separates timbers from the two features.

Component 2

Category: Transportation/Communication
Site Type: Shipwreck
Cultural Affiliation: Euro-American
Cultural Affiliation Details: No Data
DHR Time Period: Colony to Nation, Early National Period

Start Year: No Data
End Year: No Data
Comments: Ship 3 was originally recorded as Feature 159 at Site 44AX235. It is a mid to late 18th century merchant vessel shipwreck used for shoreline expansion. The vessel remains were excavated in 2018 and underwent short term preservation at the Alexandria City Bus Barn. Following short-term preservation and data collection, the vessel remains were wrapped in geofabric, transported, re-submerged, and secured to geogrid material at the bottom of Ben Brenman Pond, in the City of Alexandria.

A total of 705 timbers contained within 438 bundles were secured to the pond bottom from Ship 3. Of these, 367 timbers contained within 243 bundles are located on geogrid Ship 3-A and 338 timbers contained within 195 bundles are located on geogrid Ship 3-B.

Transport and submersion occurred in May 2022. Vessel remains took up the area of two 100x24-foot (30.5x7.3-meter) geogrids. Timbers selected for periodic monitoring dive assessments were placed approximately eight feet (2.4 meters) north of the southeast corner of the geogrid Ship 3-B. Monitoring bundles include 159-Bundle23, 159-Bundle51, 159-Bundle68, 159-Bundle256, and 159-Bundle285.

Feature 159 occupies the two western-most geogrids.

Component 3

Category: Transportation/Communication
Site Type: Shipwreck
Cultural Affiliation: Euro-American
Cultural Affiliation Details: No Data
DHR Time Period: Colony to Nation, Early National Period
Start Year: No Data
End Year: No Data
Comments: Ship 1 was originally recorded as Feature 155 at Site 44AX235. It is a mid to late 18th century lighter shipwreck used for shoreline expansion. The vessel remains were excavated in 2018 and underwent short term preservation at the Alexandria City Bus Barn. Following short-term preservation and data collection, the vessel remains were wrapped in geofabric, transported, re-submerged, and secured to geogrid material at the bottom of Ben Brenman Pond, in the City of Alexandria.

A total of 235 timbers contained within 120 bundles were secured to the pond bottom on geogrid Ship 1-A.

Transport and submersion occurred in May 2022. Vessel remains took up approximately 0.5 100x24-foot (30.5x7.3-meter) geogrids. Timbers selected for periodic monitoring dive assessments were placed at the southeast corner of the geogrid, approximately 41 feet (12.5 meters) north of the southeast corner of the geogrid. Monitoring bundles include 200-Bundle14, 200-Bundle53, 200-Bundle75, 200-Bundle86, and 200-Bundle102.

Feature 200 is located in the northern half of the geogrid Ship 1-A, which it shares with Feature 155, located directly west of Feature 155's full geogrid. Substantial empty geogrid material separates the two features.

Adam Parker

Survey Date:

5/2/2022

Survey Description:

Project goals were to relocate historic ship timbers documented and excavated from 44AX235, Robinson Landing South. The timbers were stored Alexandria city bus garage in temporary pools and relocated to medium term storage at Ben Brenman Pond. Timbers were wrapped in geofabric, and multiple timbers may have been bundled together based on weight. Each unit is described as a "bundle". Each bundle was then given a unique identifier linked to all timbers included in the bundle. Each bundle was then transported to Ben Brenman pond where scientific divers secured the timbers to the pond bottom on pre-laid geogrid matting. City archaeologists determined bundled to be set aside for future monitoring and these bundles were laid with each other and buoyed for future retrieval.

Current Land Use

Shipwreck, submarine

Date of Use

5/2/2022 12:00:00 AM

Comments

Three shipwrecks intentionally submerged in city pond for preservation

Threats to Resource:

Development, Other

Site Conditions:

Site deliberately buried

Survey Strategies:

Observation, Subsurface Testing

Specimens Collected:

Yes

Specimens Observed, Not Collected:

Yes

Artifacts Summary and Diagnostics:

All artifacts were excavated from Site 44AX235 from Features 155, 159, and 200. City of Alexandria archaeologists retained select ship timbers for conservation. No personal artifacts were part of the shipwreck timbers assemblage.

City of Alexandria archaeologists retained five timbers from Feature 200, three timbers from Feature 155, and 10 timbers from Feature 159 for conservation. An additional 5 timbers from Feature 159 were unable to be re-submerged and returned to the City of Alexandria for conservation.

Summary of Specimens Observed, Not Collected:

All artifacts were excavated from Site 44AX235 from Features 155, 159, and 200. Artifacts included all ship timbers associated with each of the three shipwrecks. All timbers not selected for conservation were subsequently submerged in the site boundaries.

A total of 235 timbers contained within 120 bundles were re-submerged from Feature 200. A total of 223 timber contained within 187 bundles were re-submerged from Feature 155. A total of 705 timbers contained within 438 bundles were re-submerged from Feature 159.

Robinson Landing Ponding Site (44AX253) Monitoring

Timber Inspection Report

Date: 6/8/23

Timber #: F155 Bundle 87

State of geotextile, cable ties, tags:

- geotextile - ~~good~~ excellent, looks pristine
- Cable tie - excellent
- tags - excellent

Density Meter Readings (3-5, record locations on individual timber print outs):

Location (note on timber print out)	Reading (kgf/cm ²)
1	wood too hard for reading
2	"
3	" "
AVERAGE	

Other notes:

• penetrometer broken

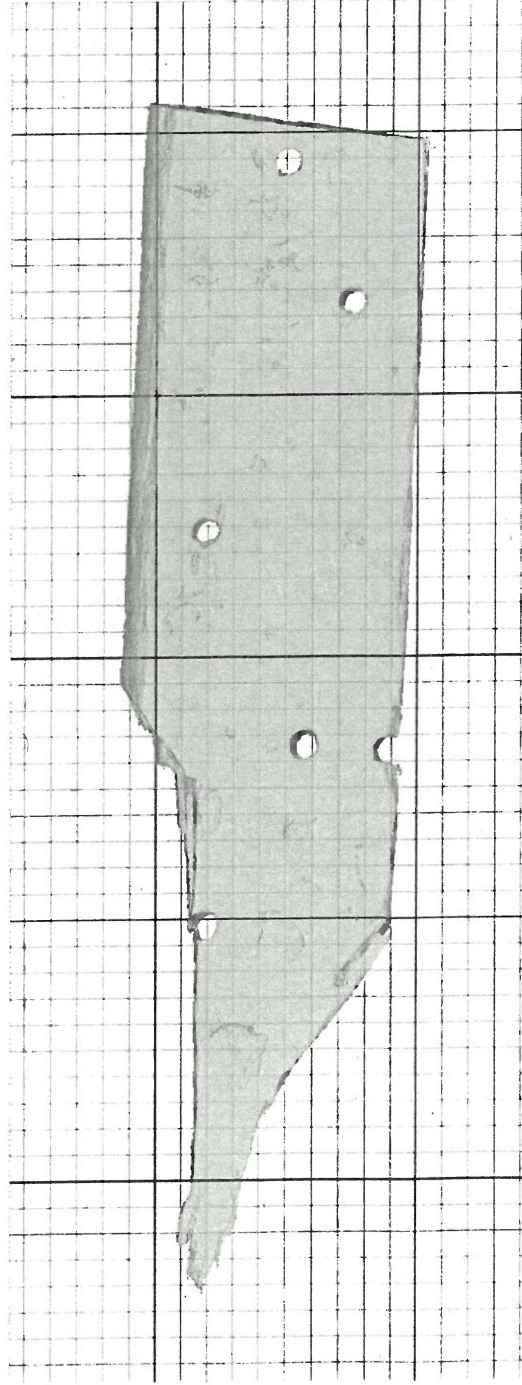

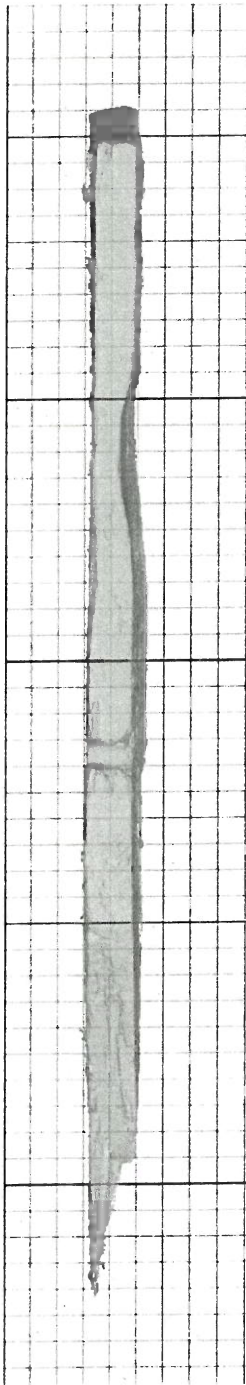

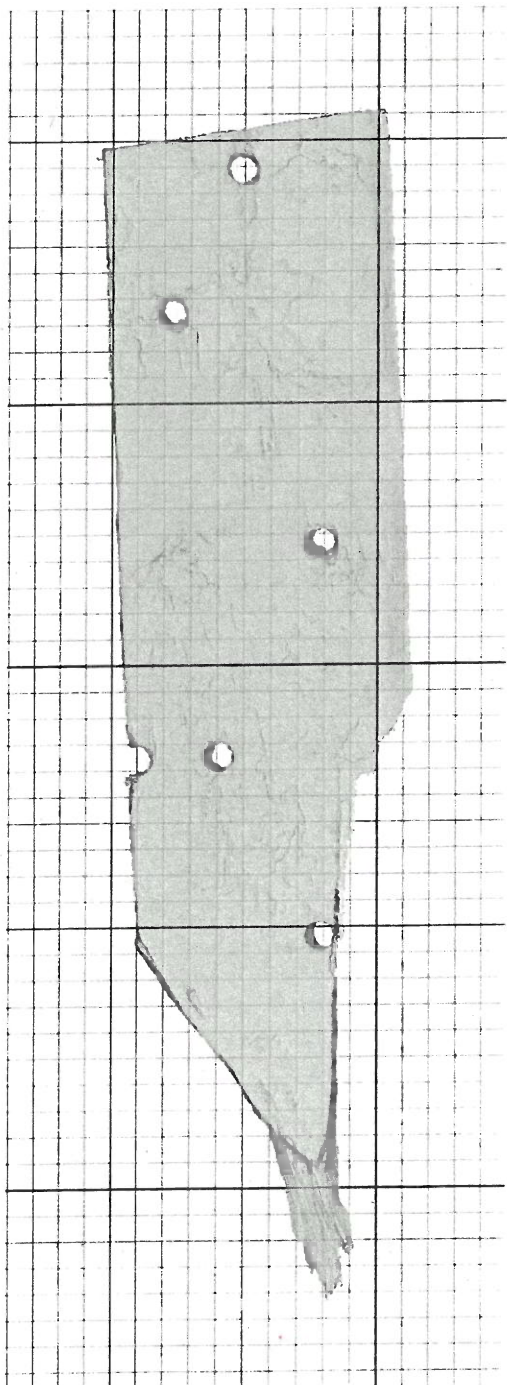

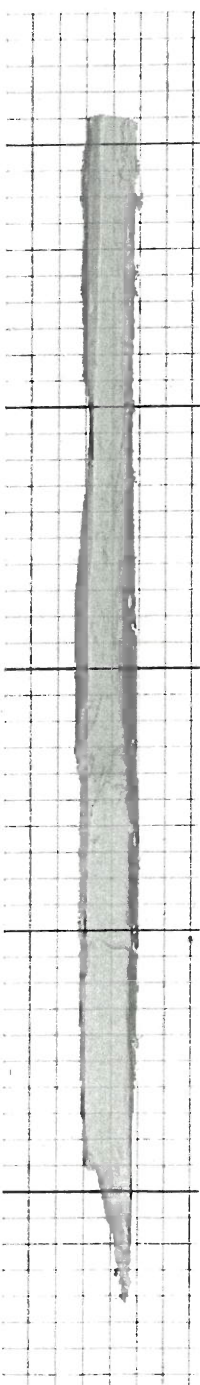

Scale 1-6

Softest - hardest

timber is a 5 on this scale

Can get a needle into the surface but not past that
